## Generalities

### What do you have to convert?

Here's an example (see [audio\\_HP6.jqz](#)) of an audio media inserted in the JCloze 6 interface:

```
<object type="application/x-shockwave-flash" data="hbs_mp3_player2but_narrow_slider.swf" width="250" height="75" style="vertical-align: middle;">
<param name="type" value="application/x-shockwave-flash" />
<param name="src" value="hbs_mp3_player2but_narrow_slider.swf" />
<param name="data" value="hbs_mp3_player2but_narrow_slider.swf" />
<param name="codebase" value="hbs_mp3_player2but_narrow_slider.swf" />
<param name="FlashVars" value="TheSound=mysoundfile.mp3" />
<param name="allowScriptAccess" value="sameDomain" />
<param name="movie" value="hbs_mp3_player2but_narrow_slider.swf" />
<param name="loop" value="false" />
<param name="quality" value="high" />
<param name="wmode" value="transparent" /></object>
```

in the data file (jqz, jcl etc.) it is written using HTML code:

```
&#x003C;object type="application/x-shockwave-flash" data="hbs_mp3_player2but_narrow_slider.swf";
width="250"; height="75"; style="vertical-align: middle;"; &#x003E;
&#x003C;param name="type" value="application/x-shockwave-flash" /&#x003E;
&#x003C;param name="src" value="hbs_mp3_player2but_narrow_slider.swf" /&#x003E;
&#x003C;param name="data" value="hbs_mp3_player2but_narrow_slider.swf" /&#x003E;
&#x003C;param name="codebase" value="hbs_mp3_player2but_narrow_slider.swf" /&#x003E;
&#x003C;param name="FlashVars" value="TheSound=mysoundfile.mp3" /&#x003E;
&#x003C;param name="allowScriptAccess" value="sameDomain" /&#x003E;
&#x003C;param name="movie" value="hbs_mp3_player2but_narrow_slider.swf" /&#x003E;
&#x003C;param name="loop" value="false" /&#x003E;
&#x003C;param name="quality" value="high" /&#x003E;
&#x003C;param name="wmode" value="transparent" /&#x003E;&#x003C;/object&#x003E;
```

Note:

&quot;	is the HTML code for	"
&amp;	is the HTML code for	&
&#x003C;	is the HTML code for	<
&#x003E;	is the HTML code for	>

And you need to convert all this into:

```
&#x003C;audio controls=&quot;controls&quot;&#x003E;&#x003C;source src=&quot;mysoundfile.mp3&quot;  
type=&quot;audio/mp3&quot;/&#x003E;&#x003C;/audio&#x003E;
```

which is equivalent to:

```
<audio controls="controls"><source src="mysoundfile.mp3" type="audio/mp3"></audio>
```

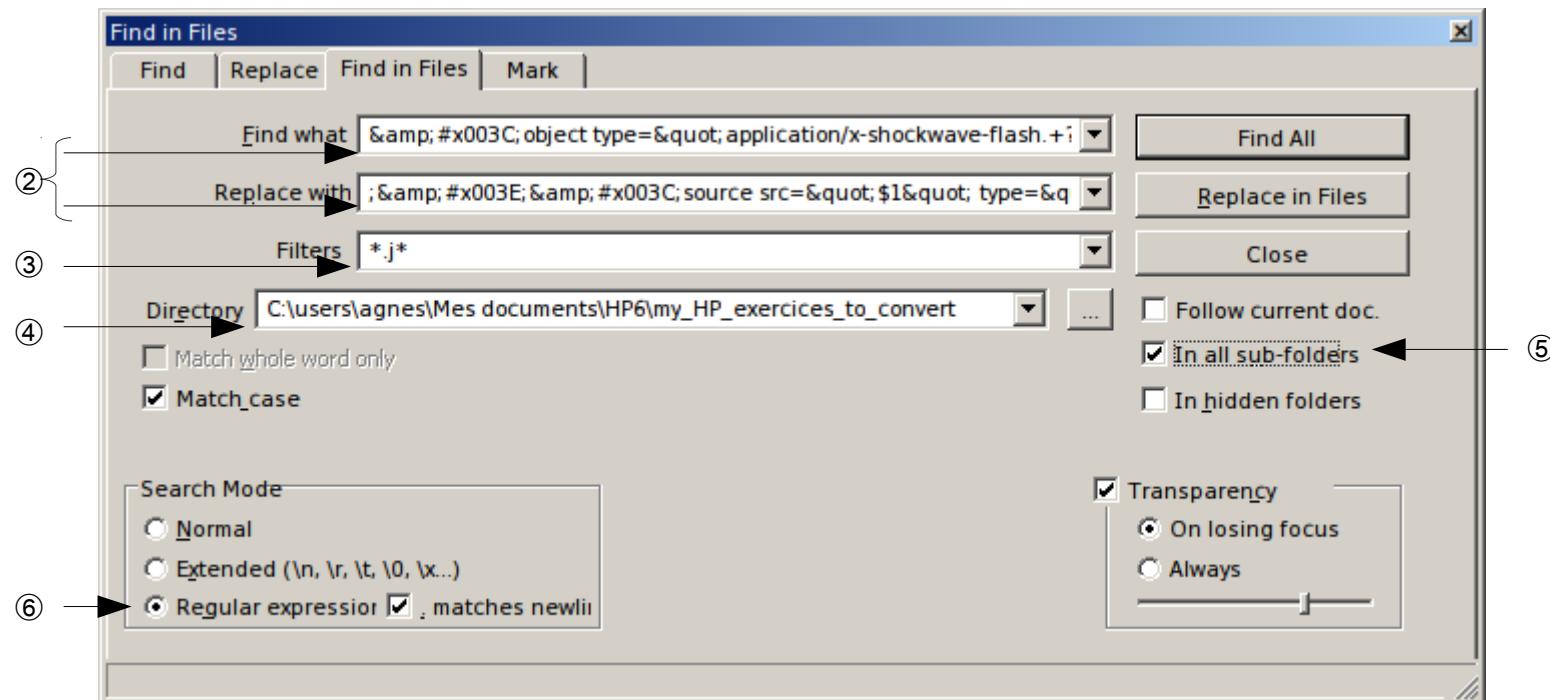

Of course you want to convert all the audio objects of a file and do this conversion for every file in different folders.

## How to make the conversion?

- You need a text editor with a search and replace function that accepts regular expressions and can do batch processing.  
I recommend [Notepad++](#) which is a very good and very useful software. It's a Windows software but it works with Wine on Linux. And it's governed by GNU General Public License.
- The method (please try it with audio\_HP6.jqz, because it may not be adapted to your own data file – see page 6):  
**Open Notepad++.**  
1- *Ctrl+Shift+F* to open the *Find in Files* window,  
2- Enter the Find and Replace phrases (see the explantion page 5 ),  
Find: &#x003C;object.+?TheSound=( [^&]+).+?&#x003C;/object&#x003E;  
(all on one line)  
Replace: ;&#x003C;audio controls=&quot;controls&quot;&#x003E;&#x003C;source src=&quot;\$1&quot;  
type=&quot;audio/mp3&quot;/&#x003E;&#x003C;/audio&#x003E;  
(all on one line)  
3- Add a filter to select only the files you need to treat: \*.j\* would work in your case (it will treat only the files with an extension beginning with j),  
4-Select the folder that contains the files (possibly in sub-folders) you want to replace text in,  
5-Select the option *In all sub-folders*, if it is what you want (but you can prefer to work folder by folder),  
6-Make sure you select the options: *Regular expression* and *Matches newlines*,

7- [Optional] Hit **Find All** to be sure that the correct parts are effectively found in the files.

8- Hit **Replace in Files**.

Note : a good practice would be to test the Find and Replace with only one or two files in a test folder to be sure that everything is correct.

## Explanation

Data file:

```
&#x003C;object type="application/x-shockwave-flash"; data="hbs_mp3_player2but_narrow_slider.swf";
width="250"; height="75"; style="vertical-align: middle;" &#x003E;
&#x003C;param name="type"; value="application/x-shockwave-flash"; /&#x003E;
&#x003C;param name="src"; value="hbs_mp3_player2but_narrow_slider.swf"; /&#x003E;
&#x003C;param name="data"; value="hbs_mp3_player2but_narrow_slider.swf"; /&#x003E;
&#x003C;param name="codebase"; value="hbs_mp3_player2but_narrow_slider.swf"; /&#x003E;
&#x003C;param name="FlashVars"; value="TheSound=mysoundfile.mp3"; /&#x003E;
&#x003C;param name="allowScriptAccess"; value="sameDomain"; /&#x003E;
&#x003C;param name="movie"; value="hbs_mp3_player2but_narrow_slider.swf"; /&#x003E;
&#x003C;param name="loop"; value="false"; /&#x003E;
&#x003C;param name="quality"; value="high"; /&#x003E;
&#x003C;param name="wmode"; value="transparent"; /&#x003E;&#x003C;/object&#x003E;
```

Find: &#x003C;object.+?TheSound=([^\&]+).+?&#x003C;/object&#x003E;

Explanation:

&#x003C;object: matches the characters &#x003C;object

.: matches any character

+?: repeat minimal number of times (till TheSound= is found)

TheSound=: matches the characters TheSound=

( [^&]+): matches any character which is not &, as many times as possible

and keeps the result (here mysoundfile.mp3) in a variable \$1 which will be used in the Replace phrase.

.+?: matches any character, repeat minimal number of times (till #x003C;/object&#x003E; is found)

&#x003C;/object&#x003E;: matches the characters #x003C;/object&#x003E;

So all the text from &#x003C;object to &#x003C;/object&#x003E; will be found and mysoundfile.mp3 is kept in a variable.

**Replace:** &#x003C;audio controls="controls"&#x003E;&#x003C;source src="\$1"&quot;  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;

**Explanation:**

&#x003C;audio controls="controls"&#x003E;&#x003C;source src="": writes &#x003C;audio  
controls="controls";&#x003E;&#x003C;source src="";

\$1: writes the value of \$1 which is *mysoundfile.mp3*

" type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;: writes "  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;;

So &#x003C;audio controls="controls"&#x003E;&#x003C;source  
src="mysoundfile.mp3"; type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;  
will be written, which is equivalent to:

<audio controls="controls"><source src="mysoundfile.mp3" type="audio/mp3"></audio>

## Adaptation to your data file

### How to write the Find phrase and the Replace phrase?

There were a lot of ways to add audio objects in HP6.

You will have to **adapt the Find and Replace phrases** to your situation. With the explanation above you should be able to do it.

The important points are:

- All the codes begin with &#x003C;object (equivalent to <object>) and end with &#x003C;/object&#x003E; (equivalent to </object>)
- You must be able to find specific characters just before and after the soundfile name.

## Examples

Lots of Hot Potatoes users have used players from [Stan Bogdanov's site](#), or the flash player proposed in the interface .  
Here's the Find and Replace phrases for the most used players.

### 1) hbs players

There were a lot of : hbs\_mp3\_player2but.swf, hbs\_mp3\_player2but\_narrow\_slider, , etc.

The soundfile name is always preceded by TheSound= and allways followed by &, so the Find phrase and Replace phrase explained above (page 5) will work:

Find phrase:&#x003C;object.+?TheSound=([&]+).+?&#x003C;/object&#x003E;

Replace phrase: &#x003C;audio controls="controls"&#x003E;&#x003C;source src="\$1";  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;

### 2) P.Y.G. player

Usually the inserted code looks like:

```
<object type="application/x-shockwave-flash" data="pyg_player.swf?file=your_audio_file.mp3&autolaunch=false" width="220"  
height="30" style="vertical-align: middle;">  
<param name="movie" value="pyg_player.swf?file=your_audio_file.mp3&autolaunch=false" />  
<param name="FlashVars" value="my_BackgroundColor=0xE6E6FA" />  
<a href="javascript:void(0);" onclick="play('your_audio_file.mp3', '128');">Click here</a>  
<a href="http://www.macromedia.com/go/getflashplayer">You need Flash! Go get it!</a>  
</object>
```

The soundfile name is always preceded by pyg\_player.swf?file= and followed by &, so the Find and Replace phrases should be:

Find phrase:&#x003C;object.+?pyg\_player.swf?file=([&]+).+?&#x003C;/object&#x003E;

Replace phrase: &#x003C;audio controls="controls"&#x003E;&#x003C;source src="\$1";  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;

### 3) music player

Usually the inserted code looks like:

```
<object type="application/x-shockwave-flash" data="musicplayer_button.swf?  
&song_url=mysoundfile.mp3&bgcolor=E6E6FA&fgcolor=E6E6FA&colors=000000,000000,aa0000& width="17" height="17" style="vertical-align:middle;"><param name="movie" value="musicplayer_button.swf?  
&song_url=mysoundfile.mp3&bgcolor=E6E6FA&fgcolor=E6E6FA&colors=000000,000000,b80000& /></object>
```

The soundfile name is always preceded by `song_url=` and followed by `&`, so the Find and Replace phrases should be:

Find phrase: `&#x003C;object.+?song_url=([^\&]+).+?&#x003C;/object&#x003E;`

Replace phrase: `&#x003C;audio controls="controls"&#x003E;&#x003C;source src=\"$1" type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;`

### 4) dewplayer

Usually the inserted code looks like:

```
<object type="application/x-shockwave-flash" data="dewplayer.swf" width="200" height="20" id="dewplayer" name="dewplayer">  
<param name="movie" value="dewplayer.swf" />  
<param name="flashvars" value="mp3=mysoundfile.mp3" />  
<param name="wmode" value="transparent" />  
</object>
```

The soundfile name is always preceded by `mp3=` and followed by `"` (html code: `"`) , so the Find and Replace phrases should be:

Find phrase: `&#x003C;object.+?mp3=([^\&]+).+?&#x003C;/object&#x003E;`

Replace phrase: `&#x003C;audio controls="controls"&#x003E;&#x003C;source src=\"$1" type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;`

## 5) mp3 player

Usually the inserted code looks like:

```
<object type="application/x-shockwave-flash" data="mp3player.swf?&mp3=mysoundfile.mp3" width="180" height="18"  
style="vertical-align:middle;"><param name="movie" value="mp3player.swf" /><param name="FlashVars"  
value="mp3=mysoundfile.mp3"></object>
```

The soundfile name is always preceded by mp3= and followed by " (html code: " ) , so the Find and Replace phrases should be:

Find phrase:&#x003C;object.+?mp3=([^\&]+).+?&#x003C;/object&#x003E;

Replace phrase: &#x003C;audio controls="controls"&#x003E;&#x003C;source src="\$1"  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;

## 6) player\_mp3\_maxi

Usually the inserted code looks like:

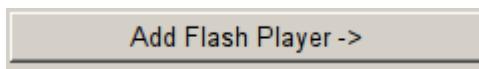

```
<object type="application/x-shockwave-flash" data="player_mp3_maxi.swf" width="51" height="20"><param name="wmode"  
value="transparent" /><param name="movie" value="player_mp3_maxi.swf" /><param name="FlashVars"  
value="mp3=mysoundfile.mp3&showstop=1&showinfo=1&width=51&showsider=0&buttonovercolor=9af000" /  
></object>
```

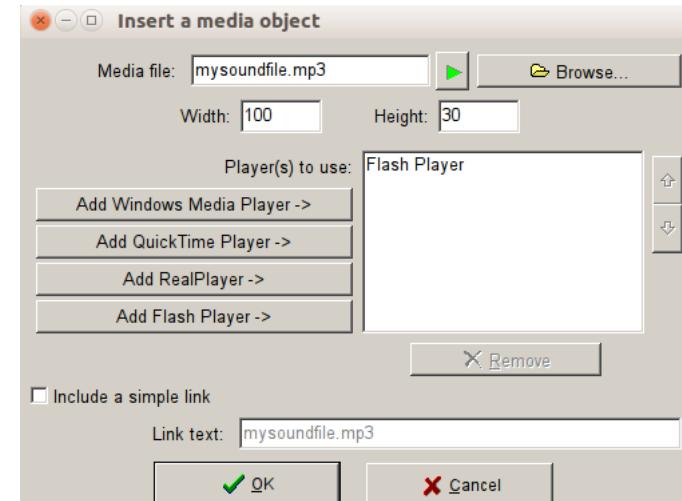

The soundfile name is always preceded by mp3= and followed by " (html code: " ) , so the Find and Replace phrases should be:

Find phrase:&#x003C;object.+?mp3=([^\&]+).+?&#x003C;/object&#x003E;

Replace phrase: &#x003C;audio controls="controls"&#x003E;&#x003C;source src="\$1"  
type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;

## 7) Flash player from the interface

For example if you have used  to insert an audio object:

Usually the inserted code is :

```
<object codebase="mysoundfile.mp3" type="application/x-shockwave-flash" width="100" height="30" data="mysoundfile.mp3"> <param name="movie" value="mysoundfile.mp3" /></object>
```

The soundfile name is always preceded by `codebase="` and followed by `"` (html code: `"`) , so the Find and Replace phrases should be:

Find phrase: `&#x003C;object.+?codebase="([^\&]+).+?&#x003C;/object&#x003E;`

Replace phrase: `&#x003C;audio controls="controls"&#x003E;&#x003C;source src="$1"; type="audio/mp3"/&#x003E;&#x003C;/audio&#x003E;`

## Warnings

- First of all **make a backup copy of your files** and keep them in a safe folder.
- A little difference in your code (an added space for example) could lead to a complete mess in the converted data file. So always work on a copy and make tests with one or two files before converting all your files in batch mode.
- If you have used different SWF widgets in the same data file you can't use this method (unless the soundfile names are always preceded by the same characters – for example, if you have used different hbs players).
- If you have used a widget for audio files and a widget (the same or not) for video files you can't use this method.

## What to do after conversion?

After the conversion of the data file you will **have to recreate every htm file**, one by one, using HP7. Hopefully it's quite repetitive: you can create a hundred of files per hour (it will be longer if you want to use an add-on for some of them).

So it's a lot of work but your old exercises will be up to date.
