

Print area code;

Remember: There are 3 parts to this script.

1. Put This Code In The HEAD of Your Page. Start copying here:

```
<script language="JavaScript">
var gAutoPrint = true; // Tells whether to automatically call the print function
function printSpecial()
{
if (document.getElementById != null)
{
var html = '<HTML>\n<HEAD>\n';
if (document.getElementsByTagName != null)
{
var headTags = document.getElementsByTagName("head");
if (headTags.length > 0)
html += headTags[0].innerHTML;
}
html += '\n</HE>\n<BODY>\n';
var printReadyElem = document.getElementById("printReady");
if (printReadyElem != null)
{
html += printReadyElem.innerHTML;
}
else
{
alert("Could not find the printReady function");
return;
}
}
```

```
html += '\n</BO>\n</HT>';  
var printWin = window.open("", "printSpecial");  
printWin.document.open();  
printWin.document.write(html);  
printWin.document.close();  
if (gAutoPrint)  
    printWin.print();  
}  
else  
{  
    alert("The print ready feature is only available if you are using a browser. Please update your browser.");  
}  
}  
</script>
```

---

2. Put This Part In the BODY of Your Page. You need to put the part of the page you want to have printed inside this code. Start copying this part here:

```
<div id="printReady">
```

This text here is inside the div code so when you click on the button this is what will print. The other text above will not. This way you will be able to put into your Web pages what you think your readers will want to print and leave out what you think they won't want to print.

```
</div>
```

---

3. Here are two ways you can place the link on your page for people to click on so they can print the page.

This is the text:

```
<a href="javascript:void(printSpecial())">Print this Page</a>
```

Here is the button:

```
<form id="printMe" name="printMe"> <input type="button" name="printMe" onClick="printSpecial()"  
value="Print this Page"> </form>
```
